

A B S T R A C T

A vehicle seat comprising a seat proper, a back
presenting at least a folding portion, a rigid plate
5 between the seat proper and the folding portion, a
control mechanism for locking the folding portion, and a
control member. The control mechanism has a control
piece that is pivotally mounted about an axis, said
control piece being urged about the axis towards a rest
10 position, the piece having a guide slot in which there
slides a peg that is secured to the rigid plate, a first
lateral branch extends to a closed end for receiving the
peg when the folding portion is raised, and a second
lateral branch extending to a closed end receives the peg
15 when the folding portion is folded down.
